

Vi-X (STEREO-II 2012 – 2014):

Study and Monitoring of Virunga volcanoes using TanDEM-X

F. Kervyn¹, N. d'Oreye^{2,3}, D. Derauw⁵, F. Albino¹, B. Smets^{1,2,4}

¹ Royal Museum for Central Africa

² European Center for Geodynamics and Seismology

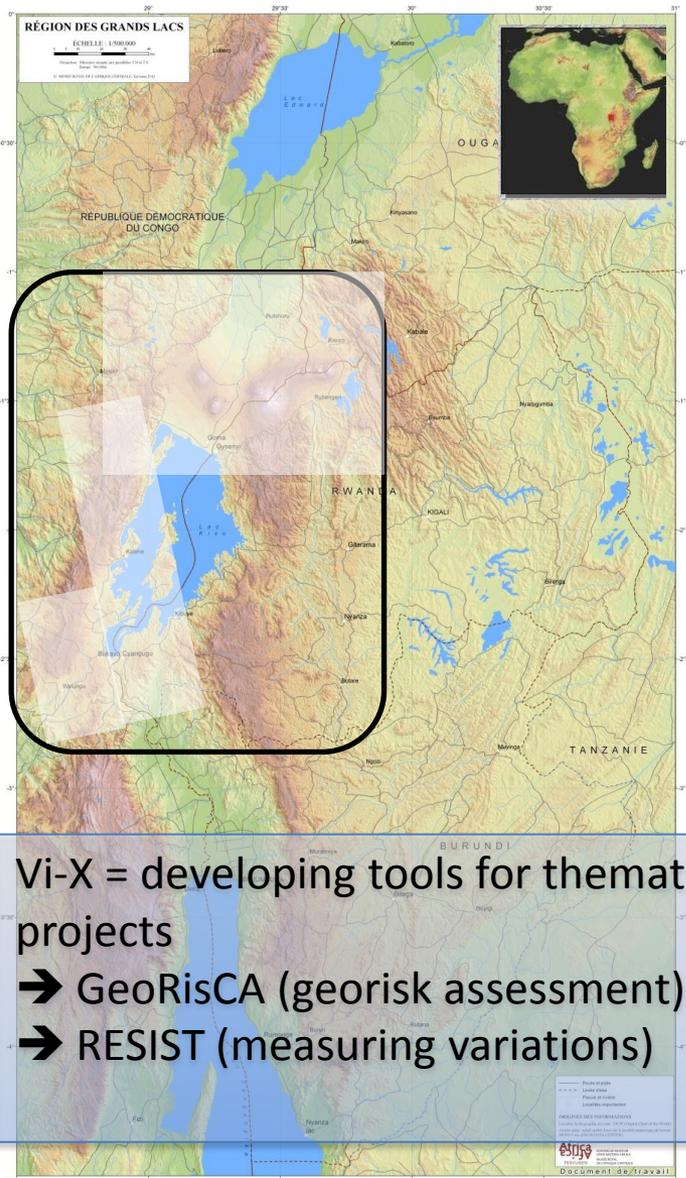

³ National Museum of Natural History

⁴ Vrije Universiteit Brussel

⁵ Centre Spatial de Liège, University of Liège

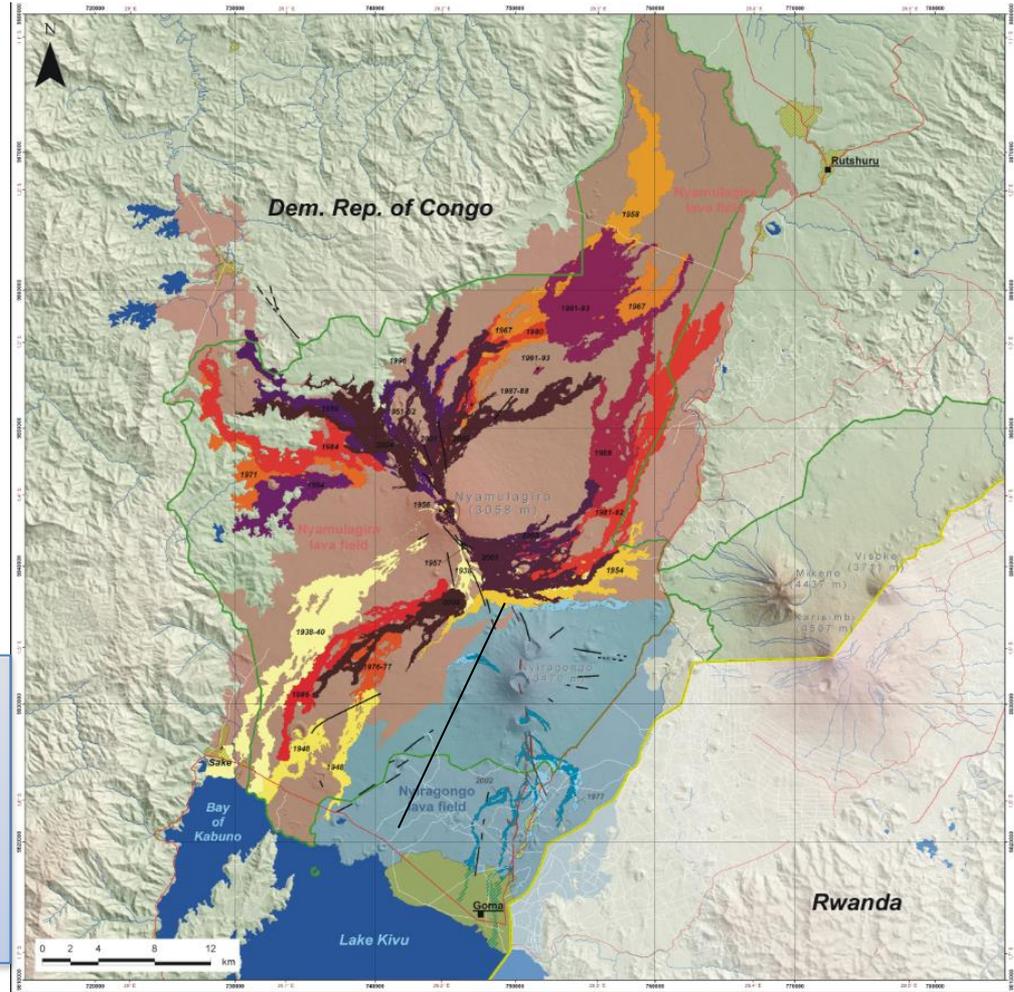

GEOLOGICAL SETTING

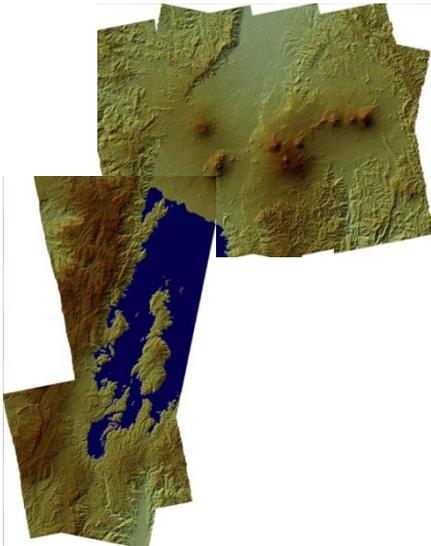

Vi-X = developing tools for thematic projects

- ➔ GeoRisCA (georisk assessment)
- ➔ RESIST (measuring variations)

Vi-X

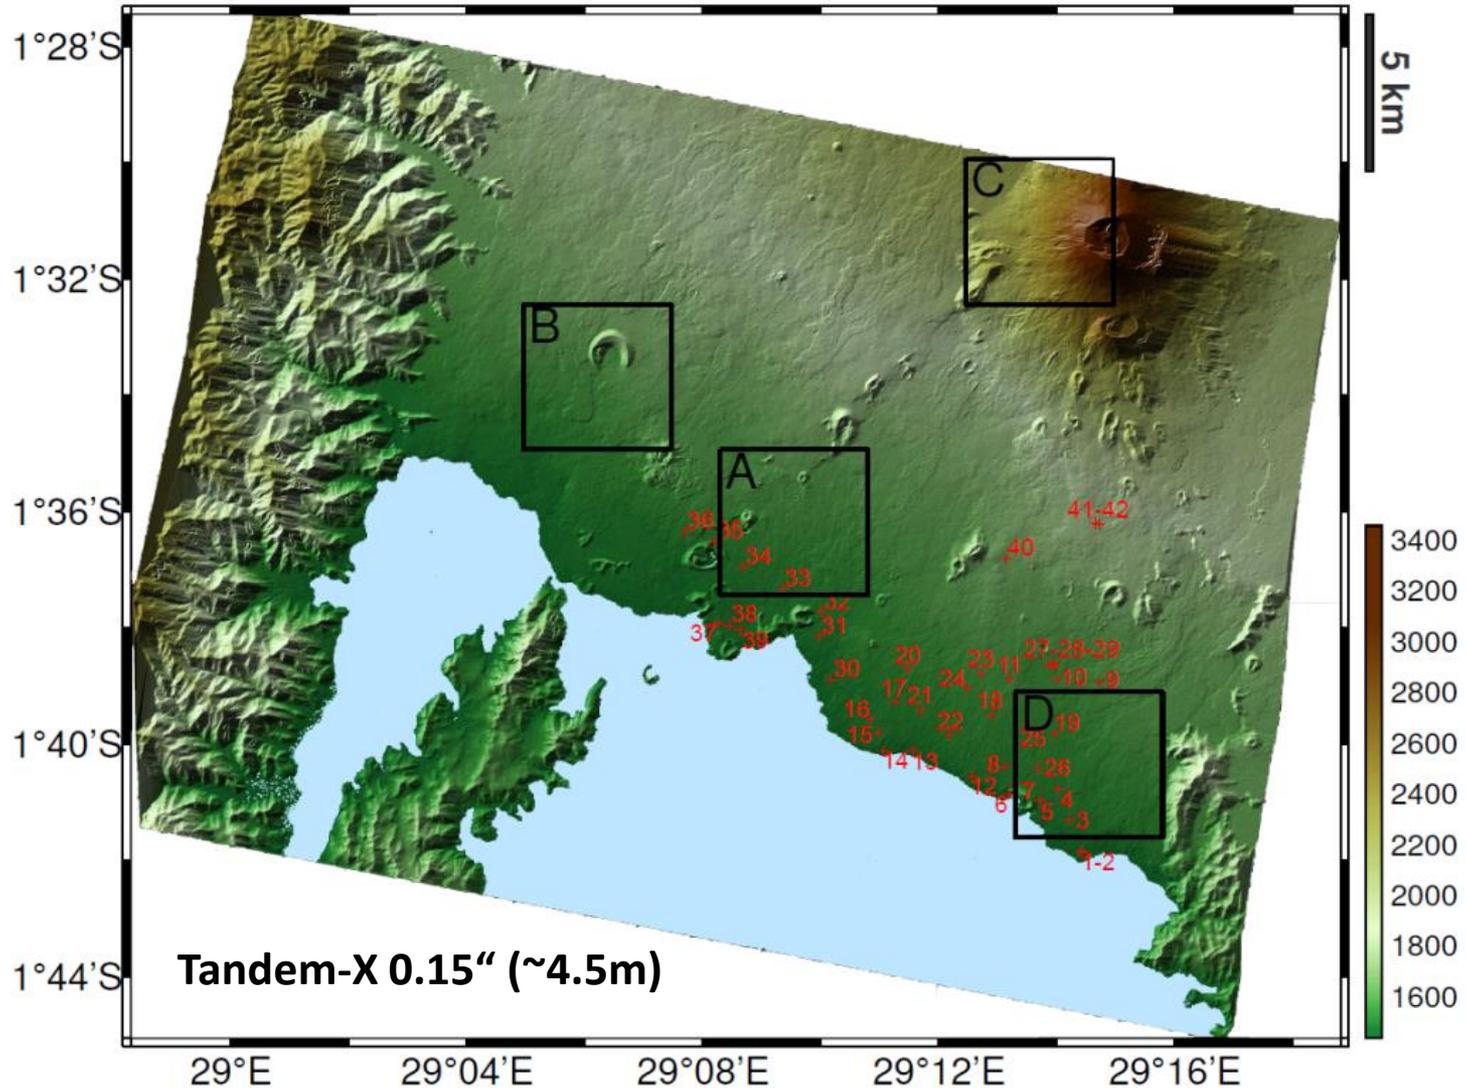

High Resolution DEM
Analysis

- ✓ DEM computation from TanDEM-X data
- ✓ Lava flow simulation
- ✓ Detailed geomorphological analysis

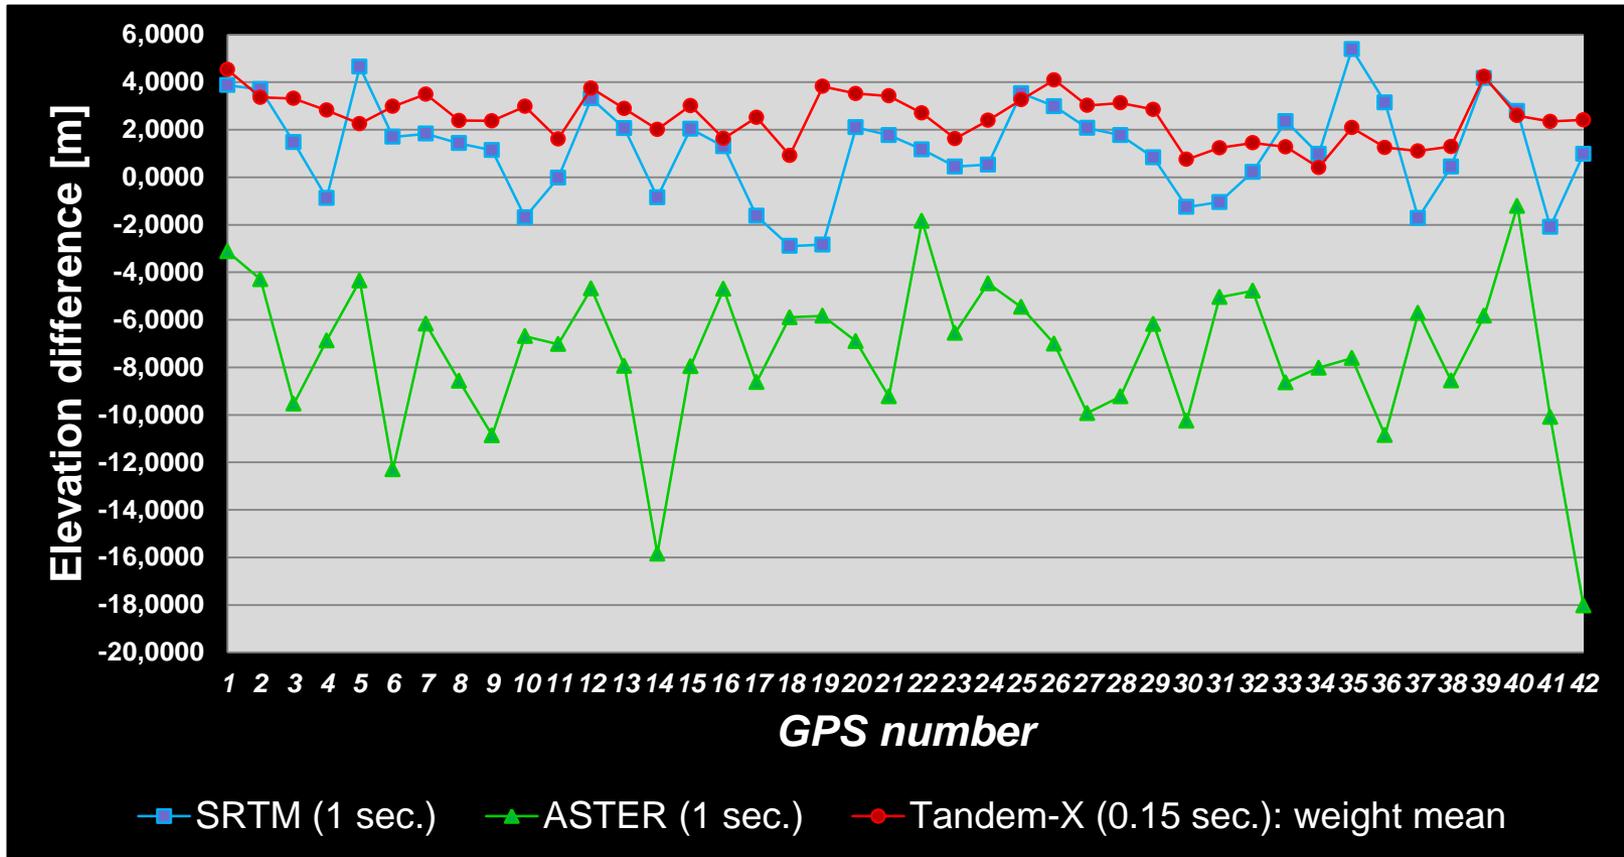

High-resolution DEM

55 DEM's were generated over the study area.

High-resolution DEM

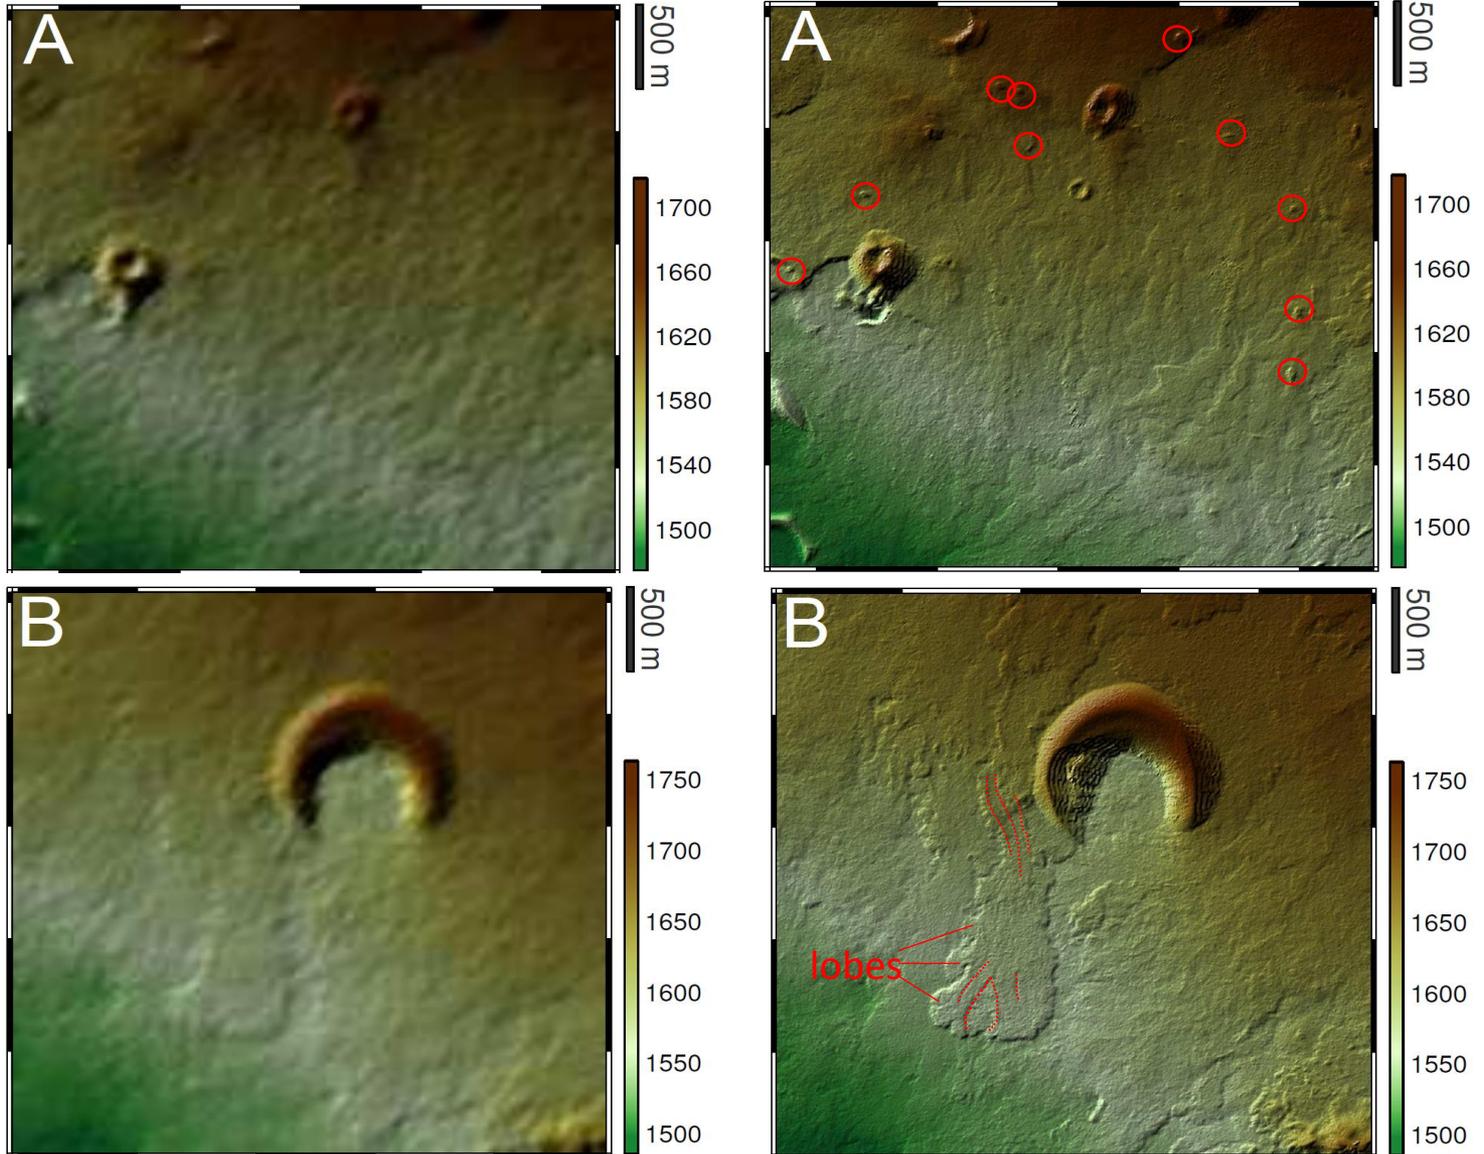

Validation of elevation data

Mean = 2.0	Mean = -7.5	Mean = 2.5
Stdev = 2.0	Stdev = 3.3	Stdev = 1.0
Rmse = 2.3	Rmse = 8.1	Rmse = 2.7

High Resolution DEM Analysis: geomorphology

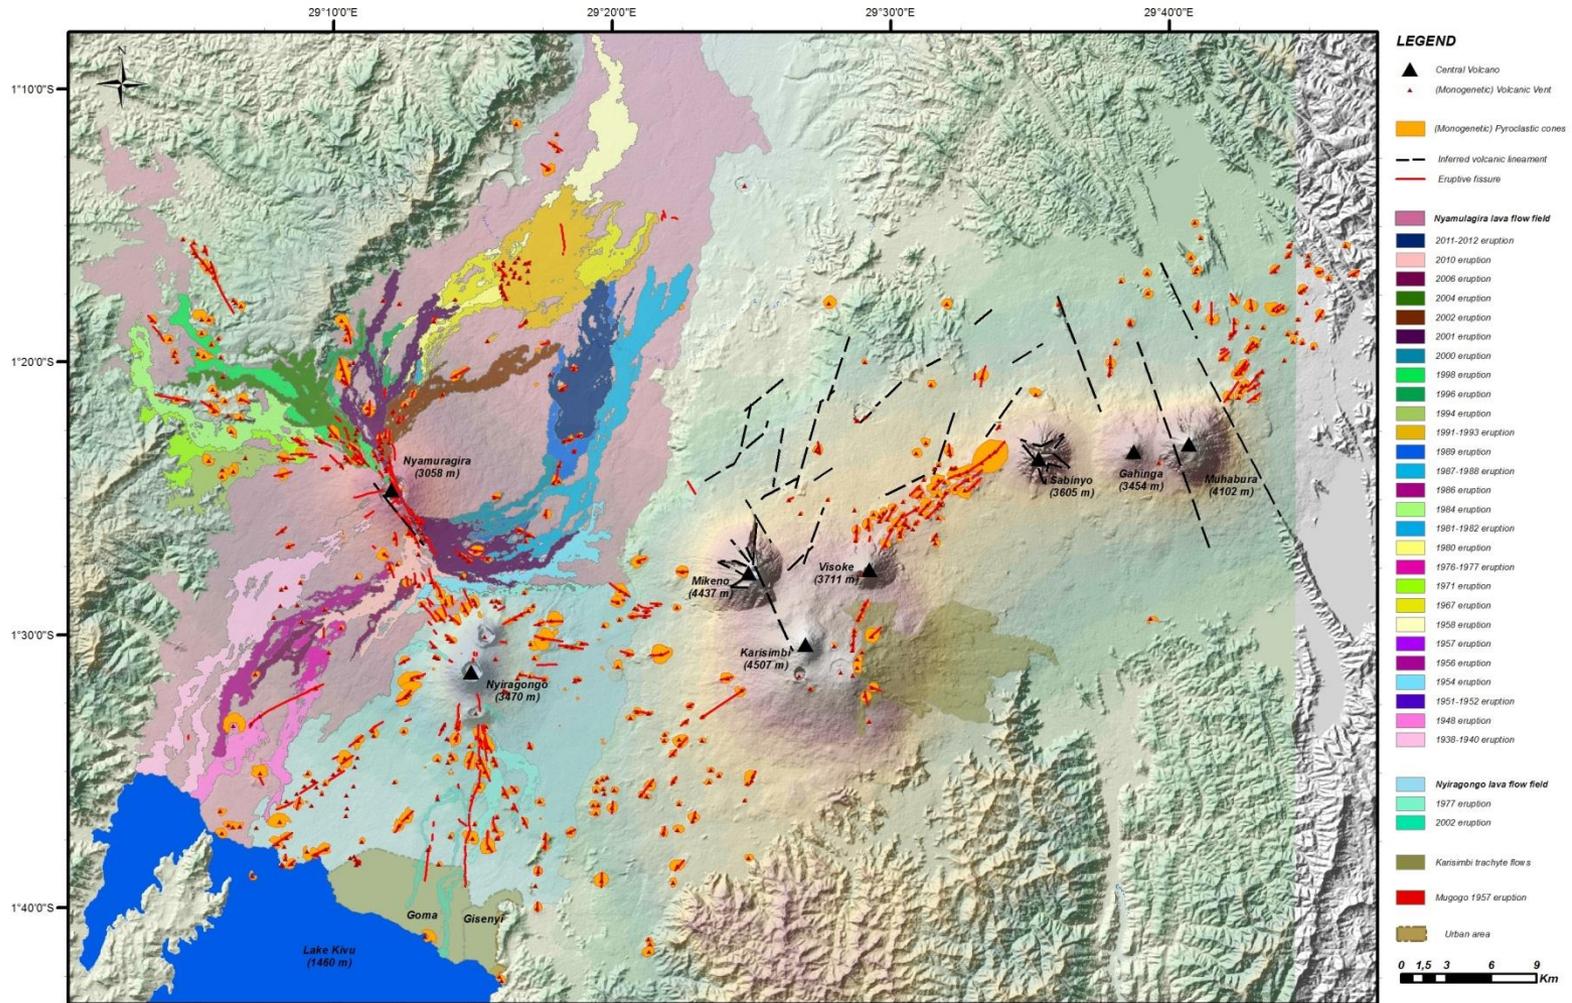

Comparison SRTM (30m) & Tandem-X DEM (4.5m)

High Resolution DEM Analysis: geomorphology

Vi-X products used as input to other projects:

Ex: GeoRisCA: production of Volcano-structural map & interpretation

High Resolution DEM Analysis: geomorphology

→ Quantification of the 2011 eruptive volume

Flow length = 10 km

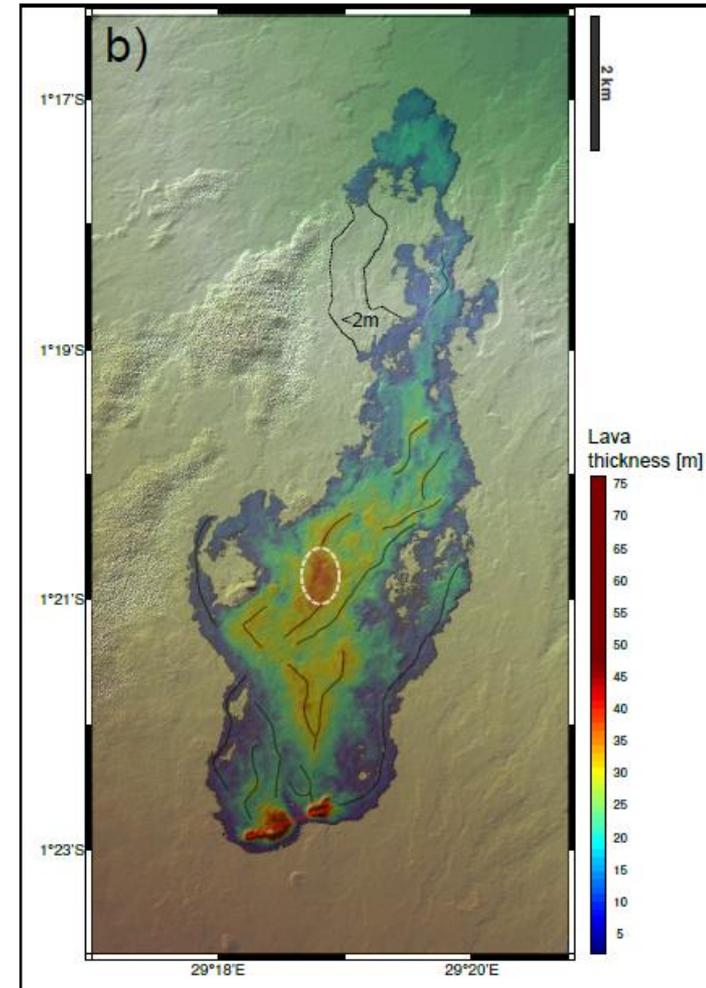

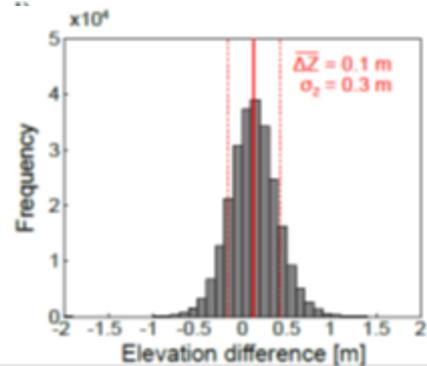

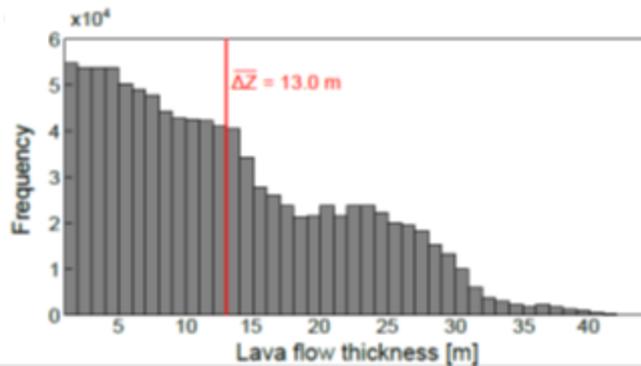

Eruption Area = 20 km²

Thickness:

- Scoria cones: 50-70 m

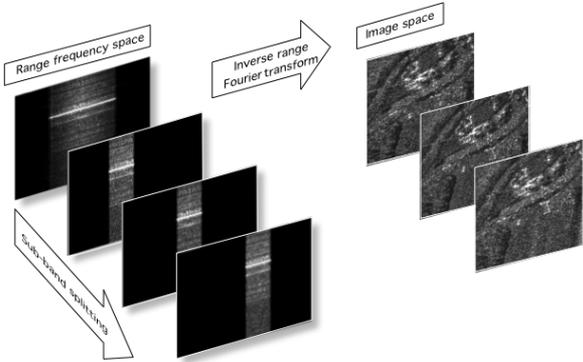

- Flow thickness: ~ 14m

Erupted Volume: 300.10⁶ m³

Vi-X

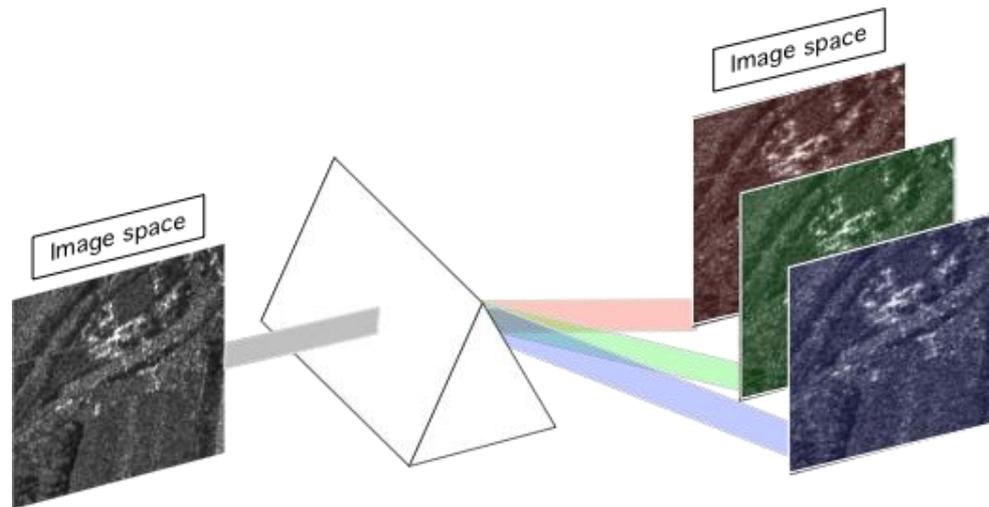

Advanced InSAR Processing

Split band SAR interferometry

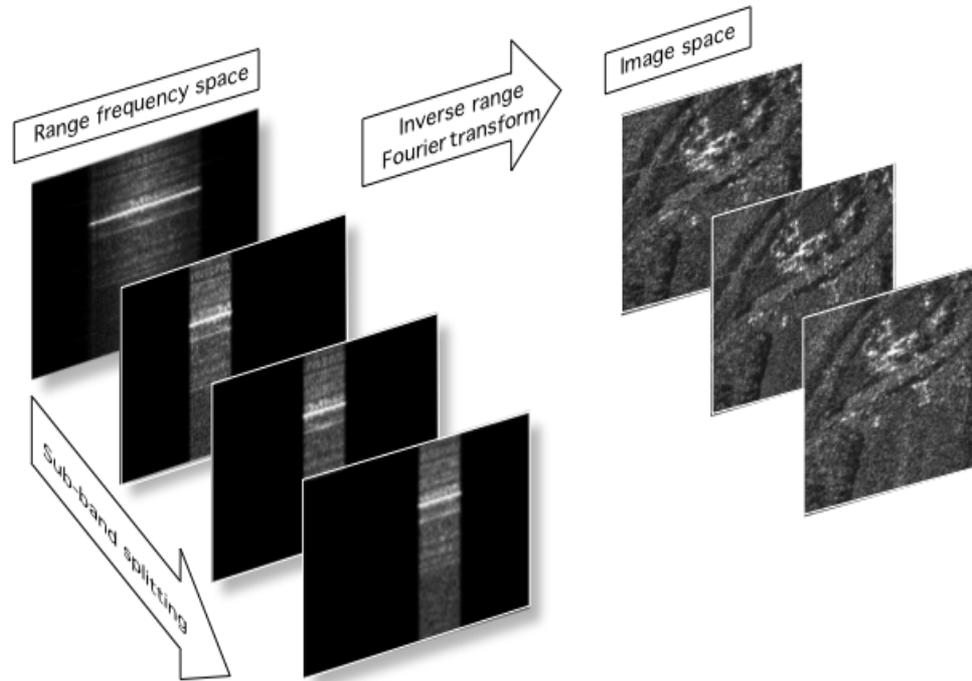

Advanced InSAR techniques: Split Band InSAR (SBIInSAR)

The process is similar to light decomposition into spectral bands by a prism. Split-band process of SAR images is also known as Multi-Chromatic Analysis (MCA):

Advanced InSAR techniques: Split Band InSAR (SBIInSAR)

Take advantage of larger bandwidth (e.g. ENVISAT 15MHz / TanDEM-X 150 MHz)

1 image is splitted into sub-images, centered on its own central frequency (or wavelength) and with a lower range resolution.

Advanced InSAR techniques: Split Band InSAR (SBInSAR)

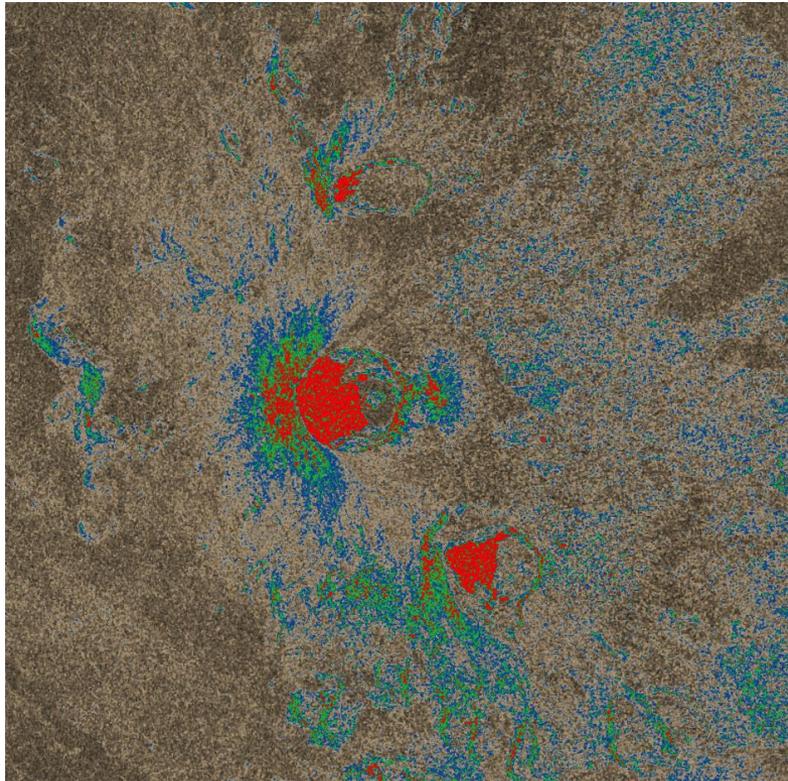

Main advantage:

- ⇒ SBInSAR allows measuring the absolute interferometric phase.
- ⇒ SBInSAR allows unwrapping the interferometric phase on a point by point basis.
 - Unconnected areas (water or vegetated areas) may be connected since the measurement is absolute.

SBlInSAR: Nyiragongo volcano crater

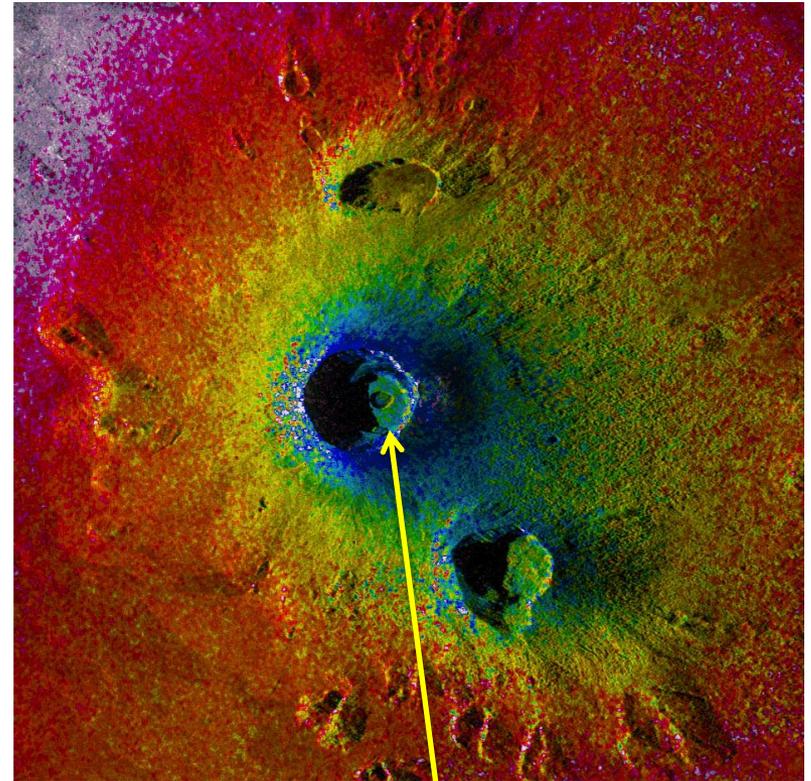

TanDEM-X 21/07/2012

50π

0

RMS error

Absolute phase

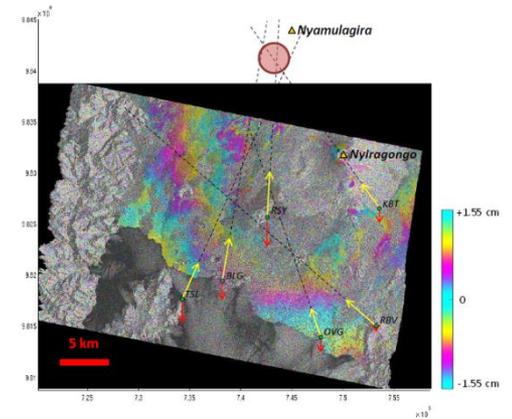

Phase corresponds to lower elevation
=> Phase unwrapping despite phase
discontinuity with crater rim

Method works but requires larger bandwidth (TSX – pursue mode, SAOCOM)

Vi-X

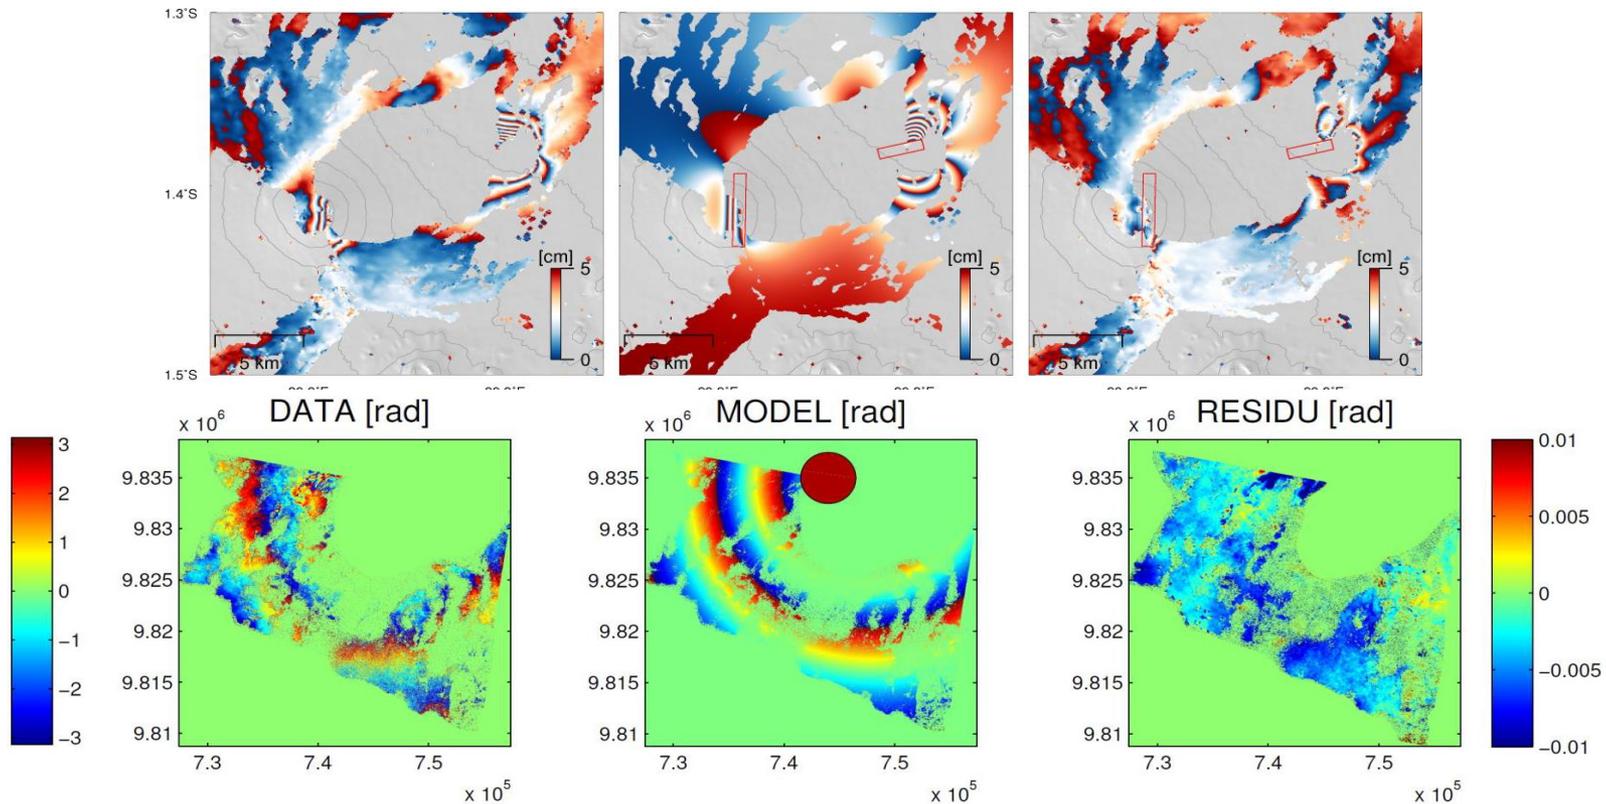

InSAR ground deformation monitoring and modeling

- ✓ Processing InSAR archives
- ✓ Processing new data

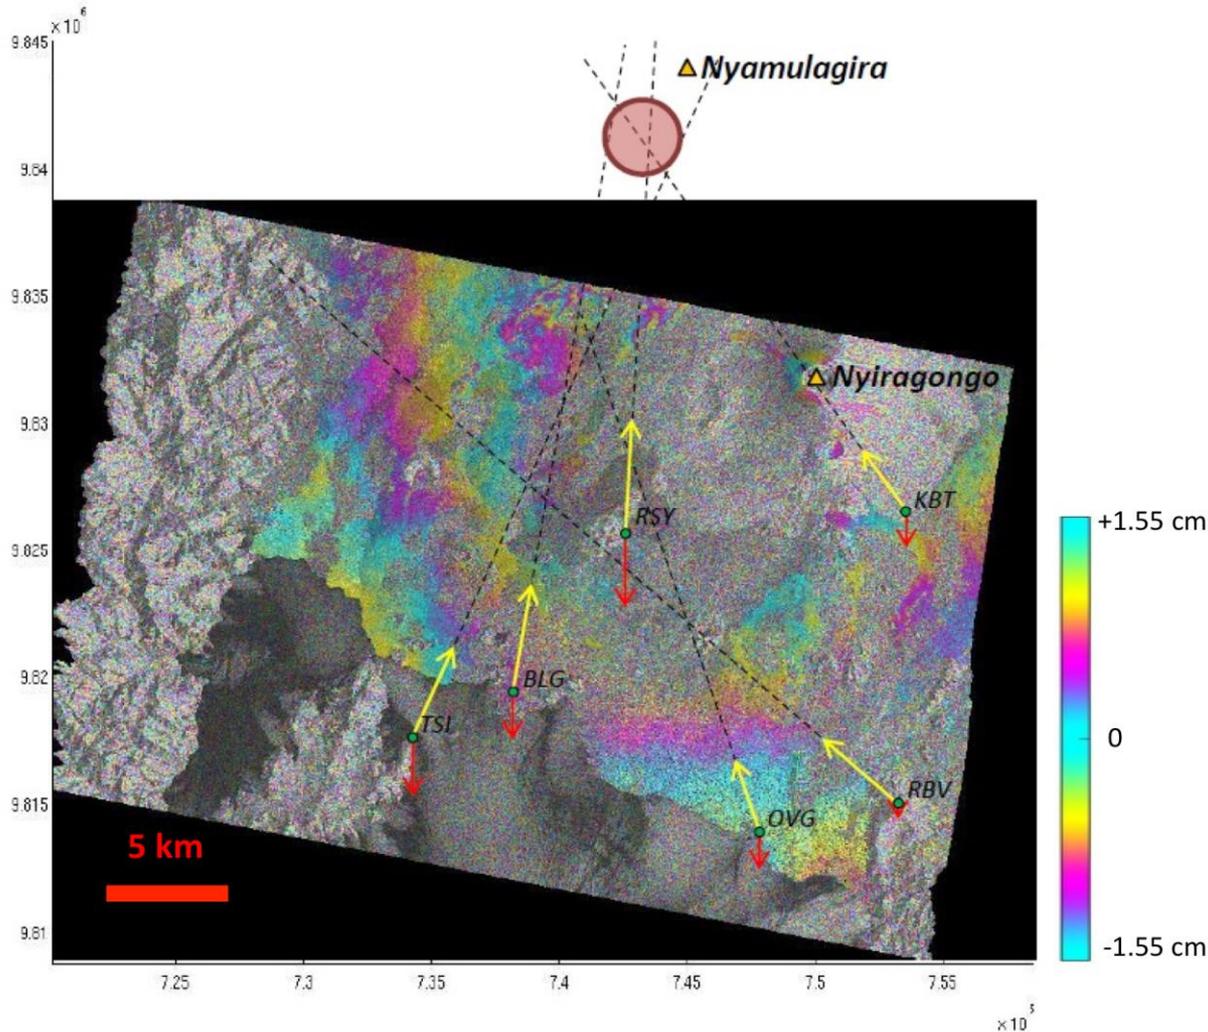

Nyamulagira eruption 2011 – 2012:

- Modeling suggest deep magma source at 20 Km
- Such deep source could explain the high frequency of eruption at Nyamulagira (~2-3 years)
- Also consistent with large erupted volume in last eruption (0.3 Km³)

Nyamulagira eruption 2011 – 2012:

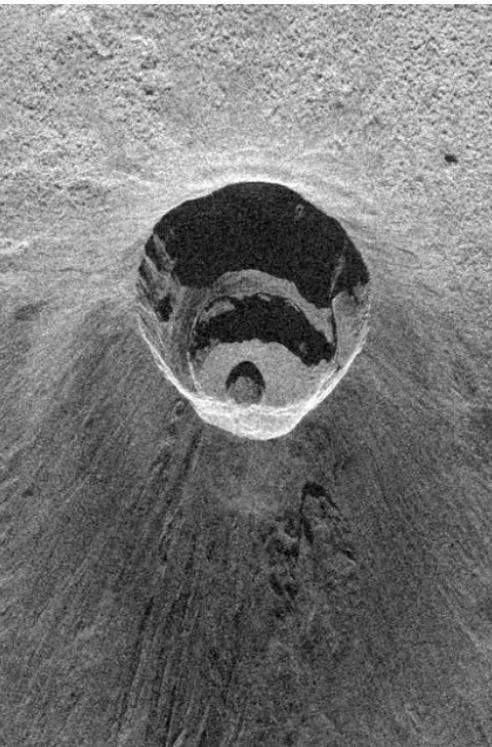

For the first time in the region, ground deformation detected simultaneously by both InSAR AND ground based system (GPS)

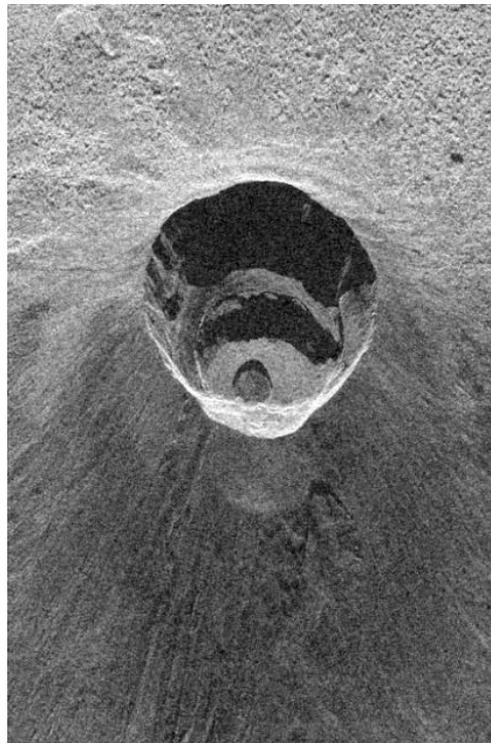

Other application: lava lake measurements

==> GeoRisCA

Shadows in intensity images can be used as a simple indicator of platforms height differences.

June 15,
2012

July 29,
2012

- ⇒ Lava lake level with respect to P3:
 - ▶ -46m on June 15, 2012
 - ▶ -27,5m on July 29, 2012
- ⇒ P3 with respect to P2:
 - ▶ -110m
- ⇒ P2 with respect to crater border:
 - ▶ -235m
