

The central graphic features the UrbanEARS logo, which is a semi-circular frame containing a satellite, a tree, a thermometer, a house with a water drop, and a pencil. Below the frame, the text 'UrbanEARS' is written in a stylized font. Surrounding this central graphic are logos for several partner institutions: KU LEUVEN, VUB (Vrije Universiteit Brussel), Universiteit Gent, UCSB, Humboldt-Universität zu Berlin, vito (vision on technology), and ULB (Université Libre de Bruxelles). The entire graphic is set against a background of a city map.

URBAN ECOSYSTEM ANALYSIS SUPPORTED BY REMOTE SENSING

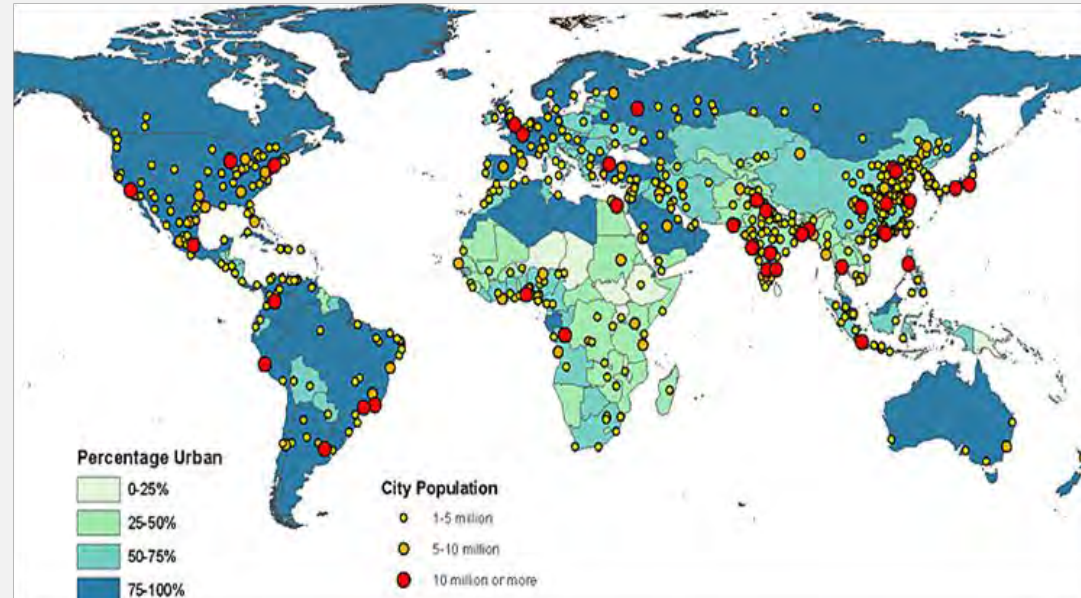

BELGIAN EARTH OBSERVATION DAY 2019

28 NOVEMBER 2019

WELCOME TO THE ANTHROPOCENE AND AN URBANIZING WORLD

% URBAN POPULATION (UN ESTIMATION)

• Fig. 1. (A) Change in world urban and rural population (%) from 1950 to 2030 (projected); plotted from data in (1). Inset shows comparable data for the United States from 1790 to 1990; plotted from data in (73). (B) Change in population of the 10 largest urban agglomerations from 1950 to 2010 (projected), ranked from left (largest) to right by their projected population size in 2010: Tokyo, Japan; Ciudad de México, Mexico; Mumbai, India; São Paulo, Brazil; New York–Newark, USA; Delhi, India; Shanghai, China; Kolkata, India; Jakarta, Indonesia; Dhaka, Bangladesh.

loss of biodiversity

WELCOME TO THE ANTHROPOCENE AND AN URBANIZING WORLD

HOW CAN WE ENSURE THE QUALITY OF LIFE IN OUR CURRENT AND FUTURE CITIES?!

SUSTAINABLE URBAN PLANNING/DEVELOPMENT/MANAGEMENT?

This urbanization and globalization context forces us to think of alternative solutions to coop with our living environment. It is clear that we urgently need additional environmental policy measures and smart urban planning schemes to secure our quality of life in this changing environment.

A collage of images illustrating various urban environmental issues. The central background is a world map. Overlaid on the map are several smaller images and diagrams:

- urban heat:** A diagram titled 'Urban Heat Island Effect' showing a city skyline with arrows indicating heat being trapped. Text below the diagram lists four points: 1. Heat surfaces and concrete absorb heat from the sun and produce heat. 2. Structures, warmed by the sun, radiate heat, and even their effect is enhanced by heat reflecting off buildings and roads. 3. The heat is reflected back to the city by the heat-absorbing surfaces of buildings and roads. 4. The result is an urban heat island effect, which can be hundreds of miles.
- air pollution:** A photograph of a city skyline obscured by a thick layer of smog or haze.
- CO₂ emission:** A photograph of a busy highway with many cars, illustrating a source of carbon emissions.
- flooding:** A photograph of a city street with buildings, showing water overflowing from the street.
- loss of biodiversity:** A photograph of a small brown bird perched on a wooden surface.
- Effects of urbanization on volume and rates of surface water runoff:** A graph showing two curves. The red curve, labeled 'Urban', is much taller and narrower than the blue curve, labeled 'Pre-urban'. The x-axis is 'Time' and the y-axis is 'Rate of flow'. Below the graph, text states: 'Urbanization increases peak flows and runoff volumes (the area under the curve)'.

URBAN BIOPHYSICAL MODELS

SUSTAINABLE URBAN PLANNING

URBAN REMOTE SENSING

Explore the **potential of the combined use of recent multi- and hyperspectral sensors**, in combination with structural information derived by LiDAR, for detailed, characterization of morphological and (bio)physical properties of the urban environment.

URBAN FLUX MODELING

Incorporating remote sensing derived information on the urban environment **into modeling of water and heat fluxes**

URBAN PLANNING

The **dynamics of the urban environment** will be accounted for by coupling biophysical modeling approaches (urban climate, hydrology) to urban growth simulation

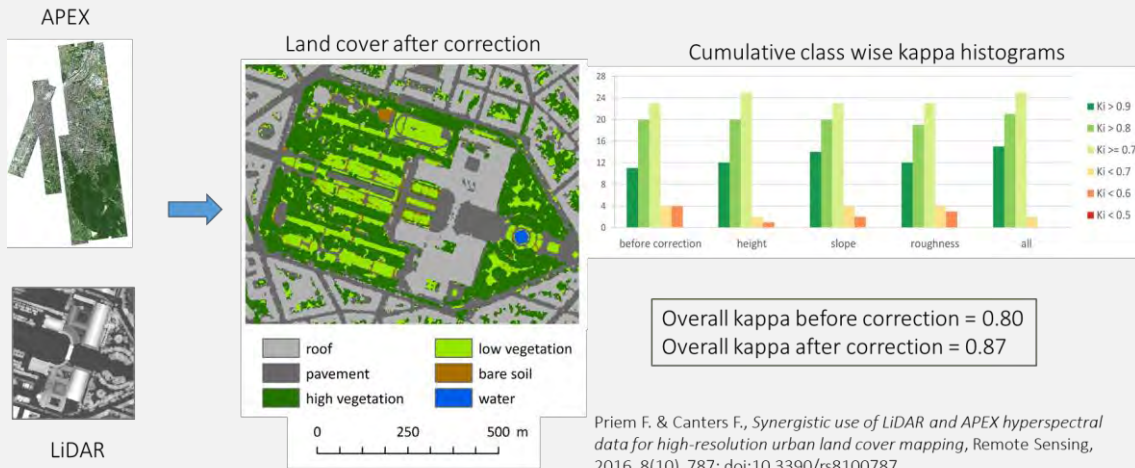

URBAN MAPPING

THE SYNERGENIC USE OF **LIDAR** AND **IMAGING SPECTROSCOPY** RESULTED IN SIGNIFICANT IMPROVEMENTS IN URBAN LAND COVER MAPPING

A detailed urban material map was made for Brussels using **Support Vector Classification of APEX data** in combination with post-classification correction based on LiDAR derived geometric features

The performance of **Spectral Unmixing via MESMA** for urban land cover mapping was significantly improved using height information derived from LiDAR data.

Priem F. & Canters F., *Synergistic use of LiDAR and APEX hyperspectral data for high-resolution urban land cover mapping*, Remote Sensing, 2016, 8(10), 787; doi:10.3390/rs8100787

Priem F. & Canters F., *Synergistic use of LiDAR and APEX hyperspectral data for high-resolution urban land cover mapping*, Remote Sensing, 2016, 8(10), 787; doi:10.3390/rs8100787

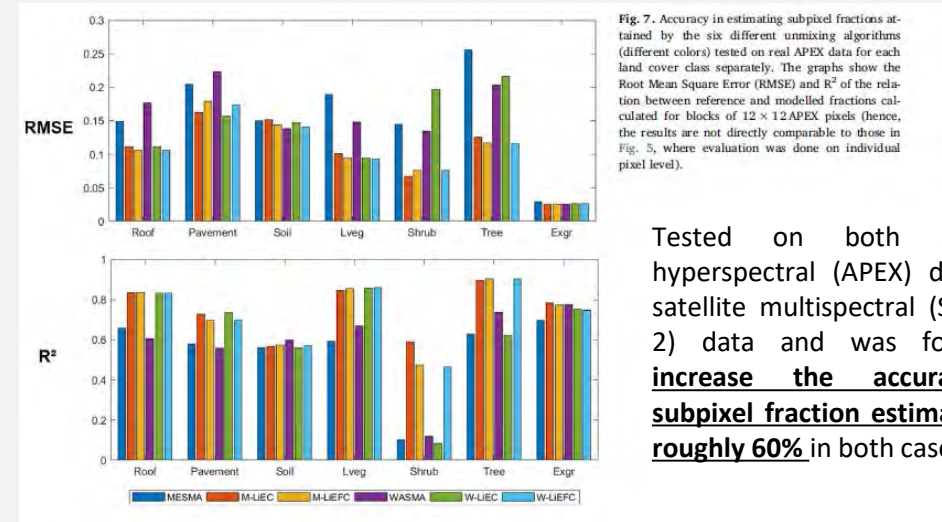

Fig. 7. Accuracy in estimating subpixel fractions attained by the six different unmixing algorithms (different colors) tested on real APEX data for each land cover class separately. The graphs show the Root Mean Square Error (RMSE) and R^2 of the relation between reference and modelled fractions calculated for blocks of 12×12 APEX pixels (hence, the results are not directly comparable to those in Fig. 5, where evaluation was done on individual pixel level).

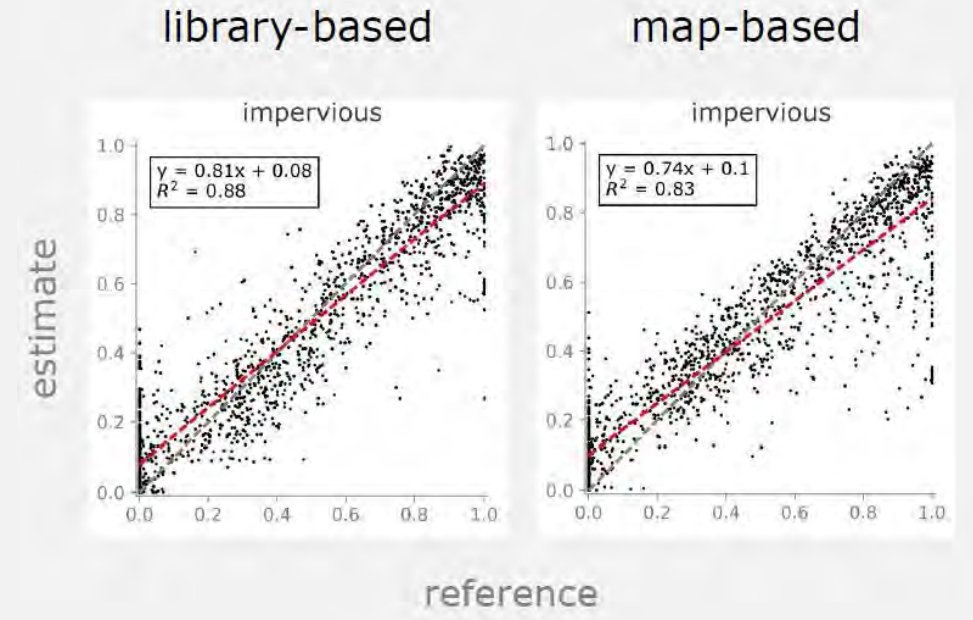

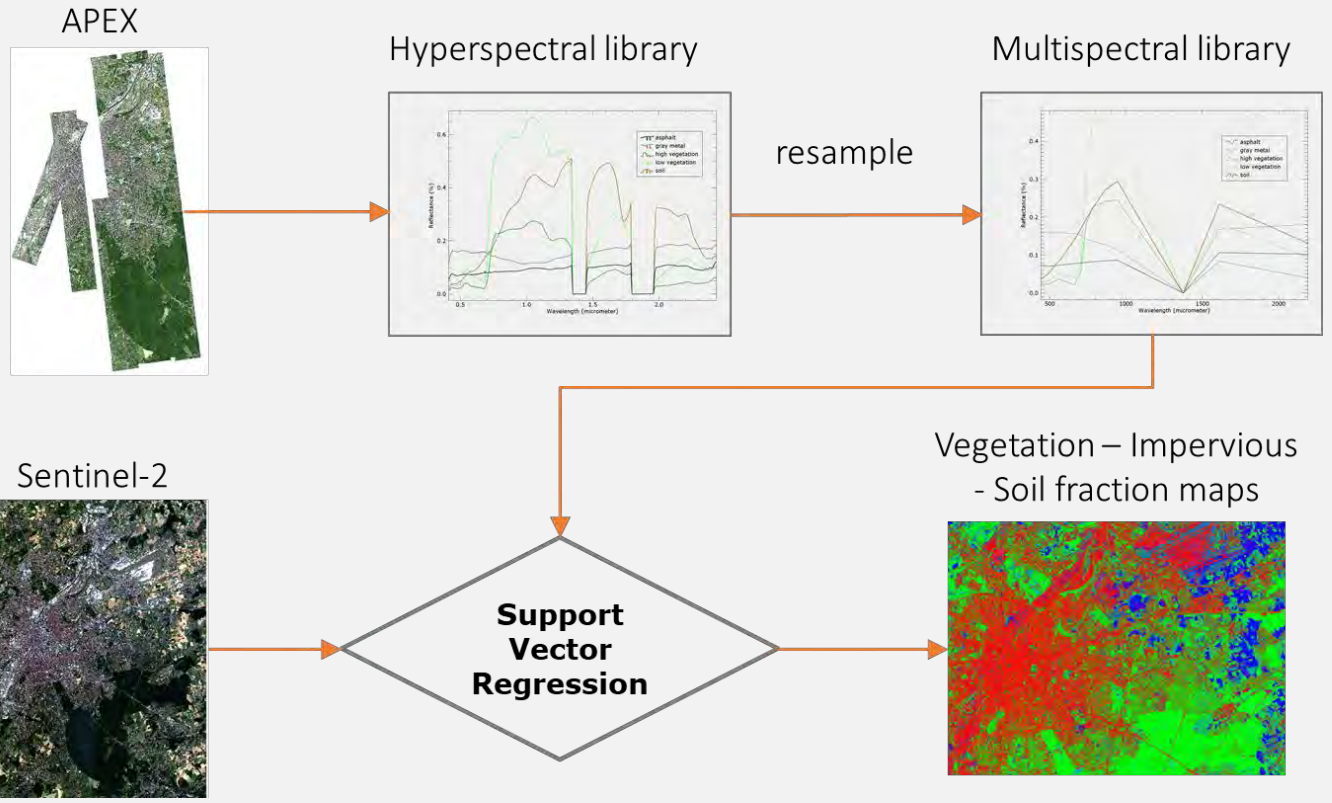

Tested on both airborne hyperspectral (APEX) data and satellite multispectral (Sentinel-2) data and was found to **increase the accuracy of subpixel fraction estimation by roughly 60%** in both cases.

Degerickx, J. Roberts, D., Somers, B. (2019). *Enhancing the performance of Multiple Endmember Spectral Mixture Analysis (MESMA) for urban land cover mapping using airborne lidar data and band selection*. Remote Sensing of Environment, 221, 260-273

URBAN MAPPING

THE SYNERGENIC USE OF **HYPERSPECTRAL DATA AND SENTINEL2** RESULTED IN SIGNIFICANT IMPROVEMENTS IN URBAN LAND COVER MAPPING

URBAN MAPPING

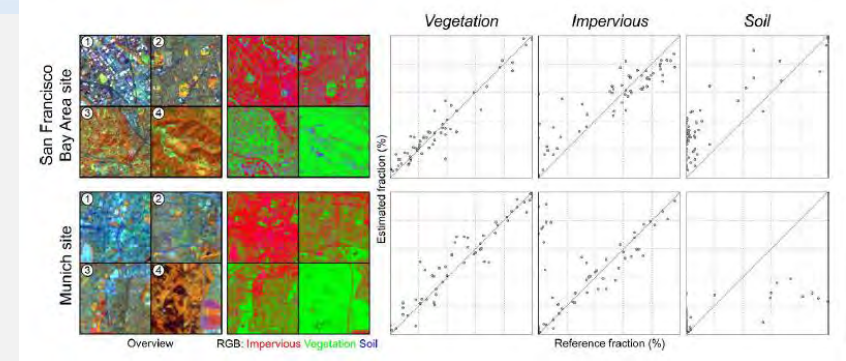

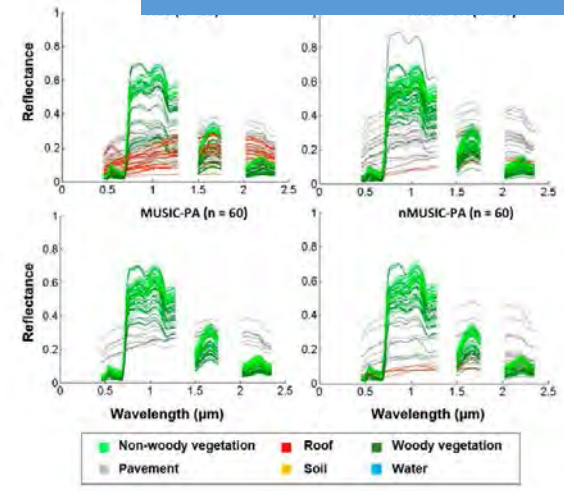

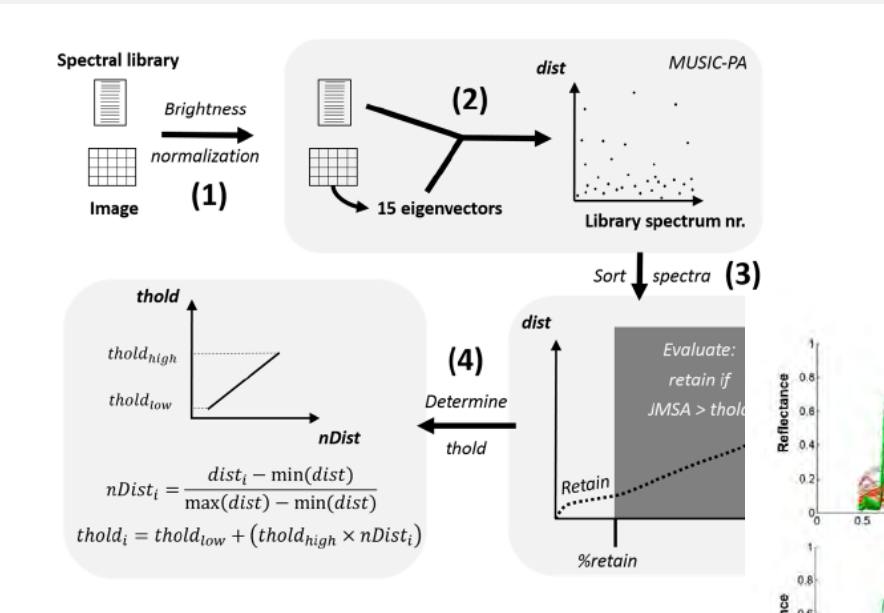

THE SYNERGENIC USE OF AN (EXTERNAL) SPECTRAL LIBRARY AND IMAGE DATA RESULTED IN SIGNIFICANT IMPROVEMENTS IN URBAN LAND COVER MAPPING

MESMA was used in combination with a **new library optimization technique** to show its potential for urban land cover mapping based on generic spectral libraries

We could illustrate that the **transferability of Support Vector Regression models** using external spectral libraries could work.

URBAN HEAT MONITORING

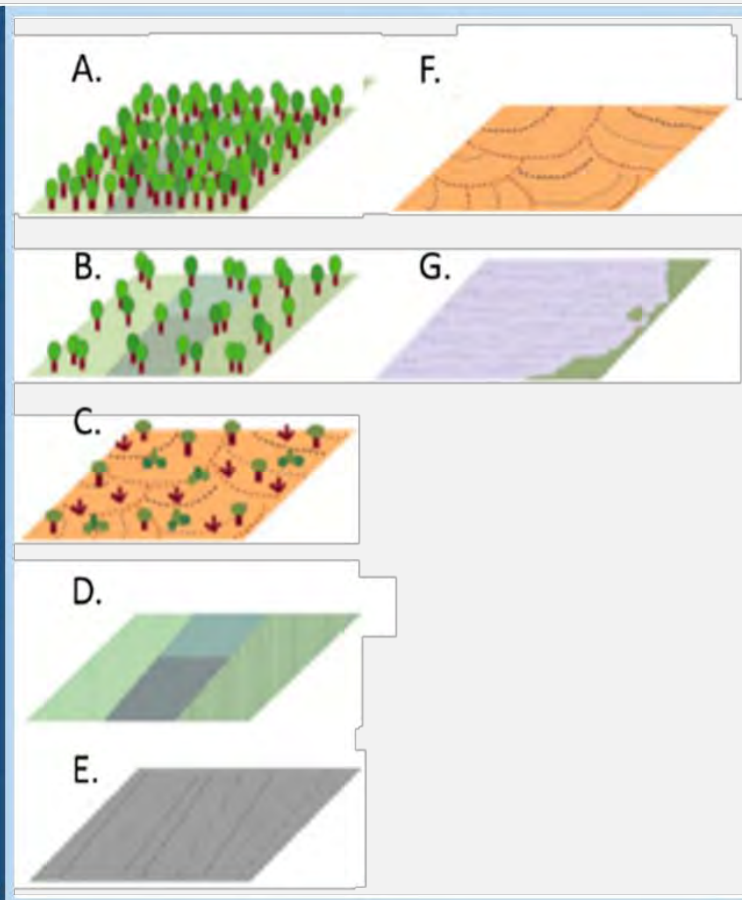

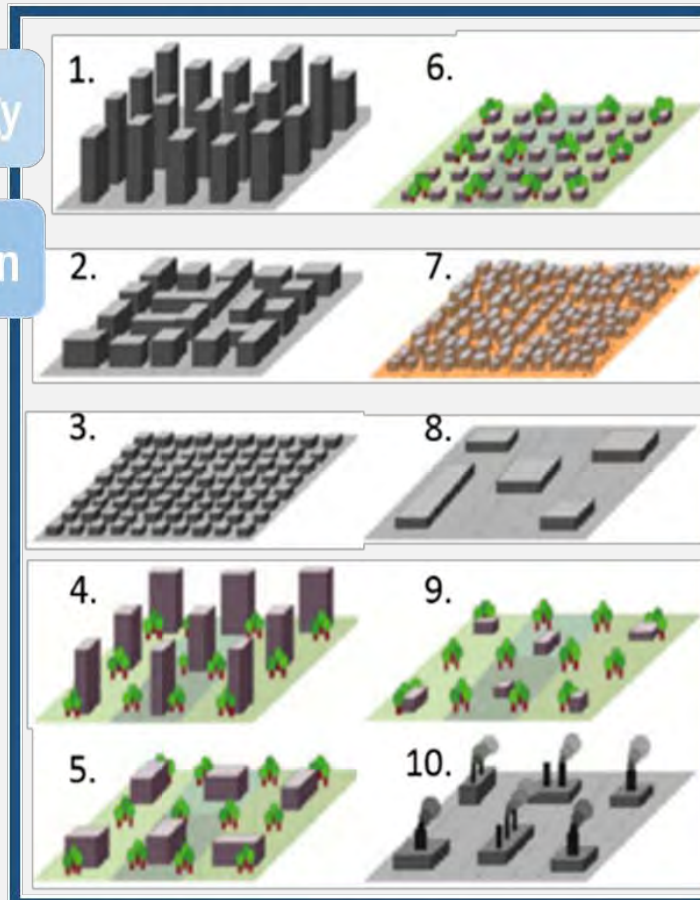

REMOTE SENSING AS A HEAT ASSESSMENT TOOL? THE **LOCAL CLIMATE ZONE** CONCEPT

Local Climate Zones

After Stewart and Oke (2012)

Morphology

Lack of vegetation

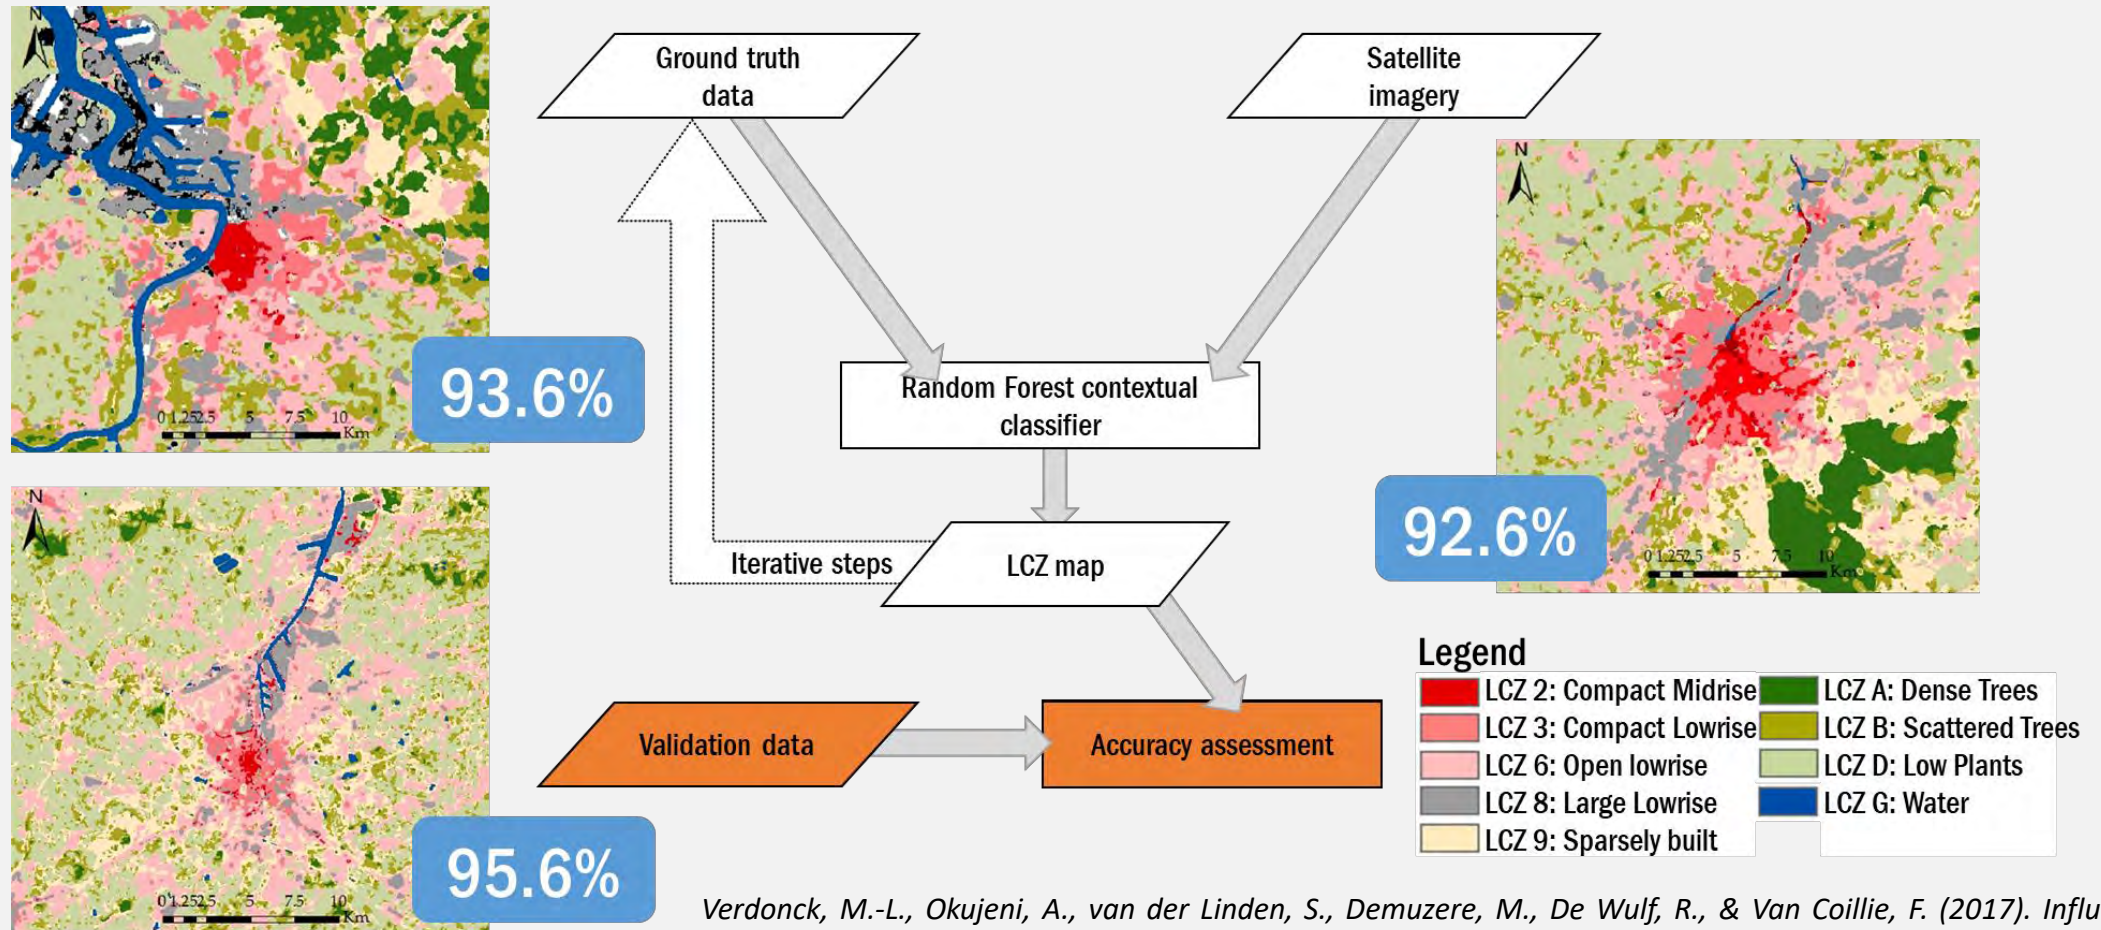

1. Compact highrise
2. Compact midrise
3. Compact lowrise
4. Open highrise
5. Open midrise
6. Open lowrise
7. Lightweight lowrise
8. Large lowrise
9. Sparsely built
10. Heavy industry

- A. Dense trees
- B. Scattered trees
- C. Bush, scrub
- D. Low plants
- E. Bare rock or paved
- F. Bare soil or sand
- G. Water
